# HOW TO RUN AMAZON SCRAPER IN JUPYTER NOTEBOOK

Step 1:

You must have Jupyter installed in your system. You can find YouTube tutorials on how to install Jupyter in your system.
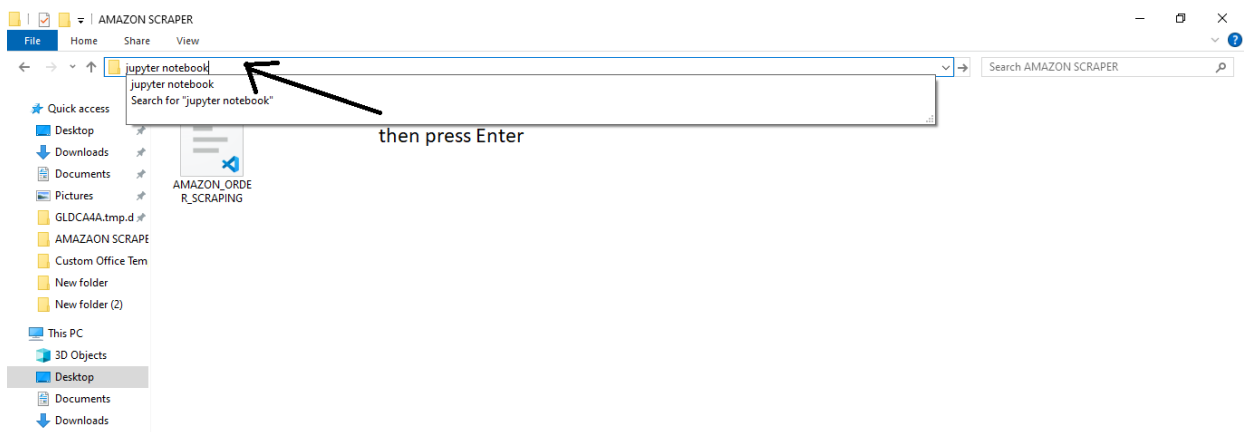

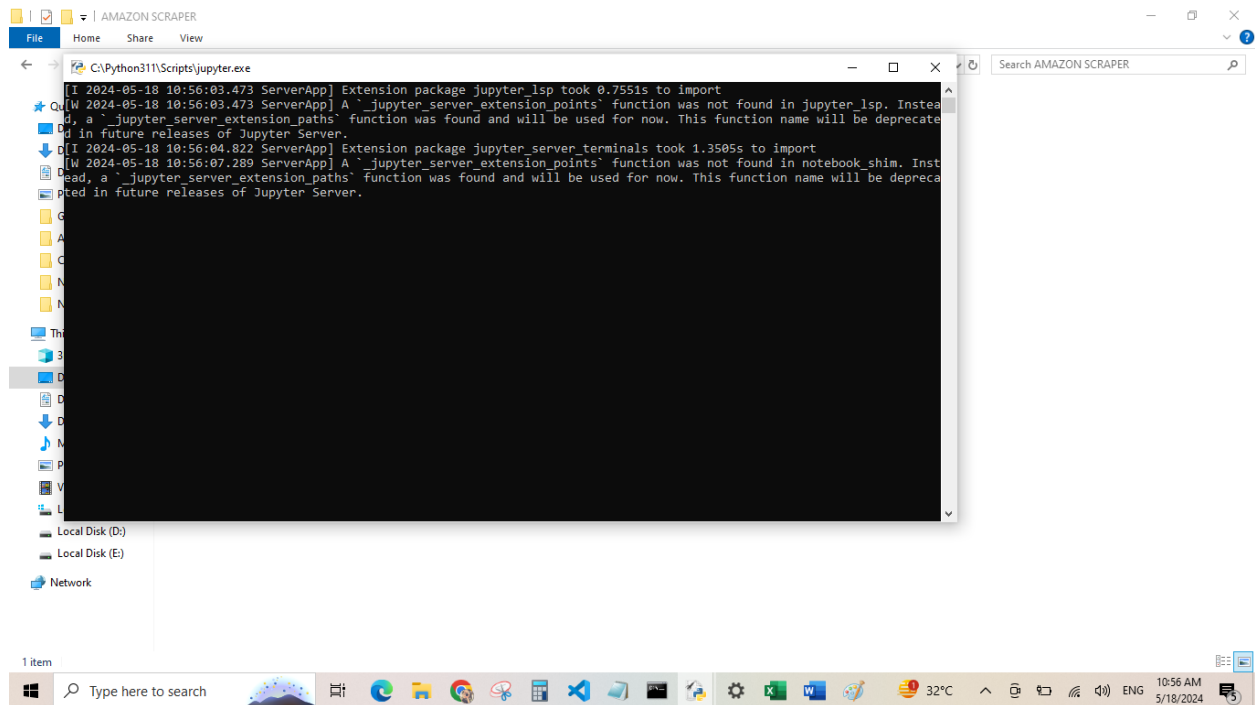

Step 2:

Once you have successfully installed Jupyter in your system, make a folder to put your code file in your PC wherever you want and Open that folder containing your code file.

Step 3:

Click on the path of this folder and type: **jupyter notebook** and then press Enter.
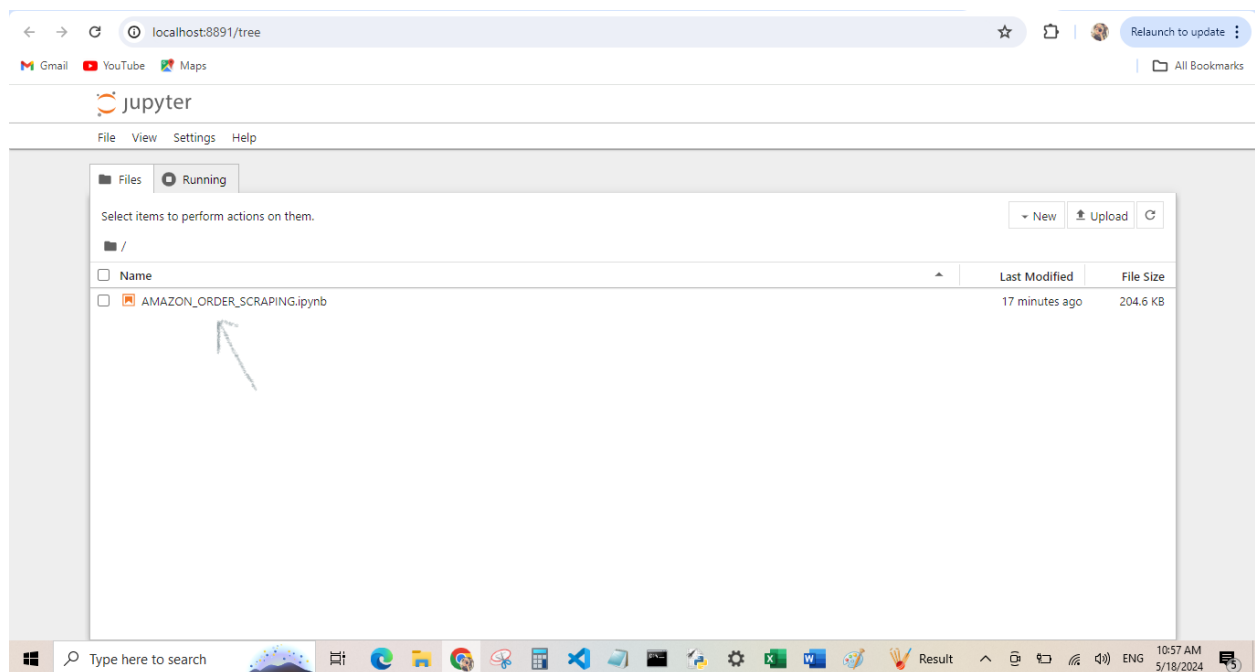

This will appear. Wait for some seconds and then Jupyter Environment will be opened.
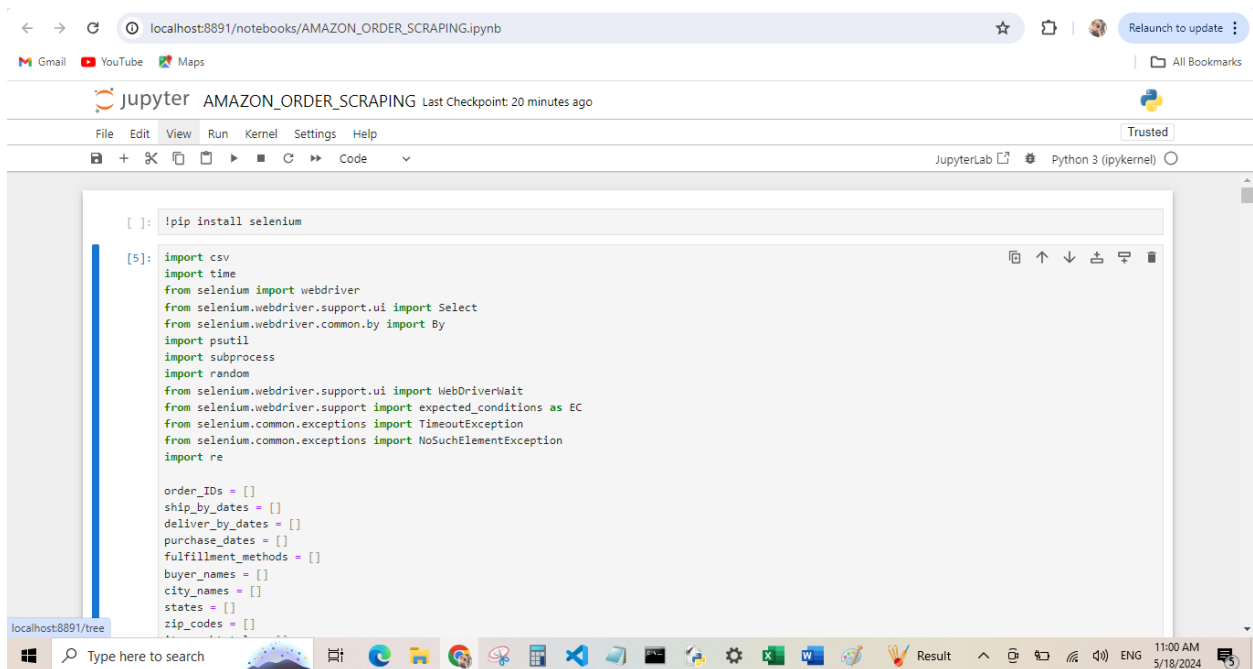

Step 4:

You will see this:

Double click the file here named as "AMAZON_ORDER_SCRAPER.ipynb".

Step 5:

This interface will open now:

First Install Selenium and then run the below code. To install selenium, click the code like "!pip install selenium" and then press **Shift + Enter.**

When the selenium is installed successfully then click below code and press **Shift + Enter.** And your code will start running.

Hour Glass at the tab indicates the code is running.

A chrome instance will Open for scraping.

NOTE:
You also need to install chromedriver.exe

You can find hands on YouTube tutorial to install the driver.
